History AutoCAD was originally created in 1982 by Joseph Ponsink (a former HP employee) and John Walker (a former Sperry Corporation employee) and was

named "Metarecorder". When a drawing was created, the user had the option of creating a binder-type file using a special font that was inserted into the header of the drawing. This application was renamed "AutoCAD" in 1986 after its graphics capabilities were tested with a planemaker's shop, and it was incorporated into Delrina. The first release of AutoCAD in 1987 contained full CAD capability and a stand-alone drawing editor. By 1987, Autodesk had decided to license the CAD technology from Joseph Ponsink and John Walker as part of a complete set of products. In 1987, Autodesk purchased Delrina's rights to AutoCAD and incorporated the Delrina functionality into Autodesk software. The

first release of Autodesk Autocad AutoLISP (briefly called AutoLISP) was released on August 24, 1987, and included only PL/I and LISP versions. The first version of Visual LISP, which supported the internal ObjectARX language, was released in 1988. The first C++ version of the ObjectARX language was released in 1994, but was never incorporated into any Autodesk product. ObjectARX was first released as a C++ language library for AutoCAD and was later released as an ObjectARX plugin for AutoCAD. ObjectARX provided a complete set of functions for graphics, CAD, and AutoCAD programming. With the release of AutoCAD 2D in 1992, Autodesk introduced a new development

environment called ADF (Autodesk Development Framework). ADF supported standard autocad tools and a LISP environment. ADF was discontinued in the 2002 release of AutoCAD LT.

Starting with the 2000 release of AutoCAD, the 2D and 3D editors have been written in Windows-based VBScript. This move was made as a direct result of an August 1997 U.S. Senate bill requiring all software developed for the U.S. government to be written in either Java or VBScript. With the release of AutoCAD 2000, Autodesk introduced its.NET programming environment..NET allowed for the rapid development of applications for use with AutoCAD without the need for an intermediate layer such as AD

What's New In?

Extended menu bar support on Windows. Use the “Windows menu” in the menu bar to toggle between drawing and command tool views. Symmetry support. Symmetry operations include mirroring, rotate and flip. Labeling: Numerous improvements to the “Locate and Define” commands including a new “Locate” tab for easier configuration and a submenu for reverse lookups. Plus updates to the “Define” command to add support for multiple

glyph types and to work with other commands like “Line and Area” and “Text.” Hints on “How do I” screens help for common problems, not just errors. Support for more CADD standards. Learn more about the new standards in AutoCAD 2020. A lot more commands and preferences. Get started with AutoCAD right now and see what’s new! Q: Passing structure as an argument to function I am trying to call the following function through a C function in a Linux kernel module.

```
void add_all_cmds(uint32_t id)
```

The above function takes an ID as an argument, it then loads all commands for the id, so that I can use them in the later. The problem

is, I don't know how to pass the ID to the function. The closest I have got is extern

```
struct add_all_cmds_ctx
```

```
add_all_cmds_ctx[]; unsigned int
```

```
add_all_cmds(uint32_t id) { if (id > 0) {
```

```
struct add_all_cmds_ctx *ctx =
```

```
add_all_cmds_ctx[id]; //... } return 0; }
```

Doing the above is causing undefined behaviour, since there are two structs

having the same name, and I am not

allowed to name them differently. I am

unable to change the name of the struct,

since the kernel module has to remain

backwards compatible. What is the right

approach for this? Thanks. A:
