Nos. 3,683,062; 4,822,811; 4,822,812; 5,173,998; 5,182,261; 5,273,934; and 5,305,000. Typically, integrated circuit chips are wrapped with a polyimide film and then epoxied in place. This epoxy is then cured to a solid state. Subsequently, the IC is subsequently attached to a printed circuit board.

A disadvantage to these methods is that an adhesive is used to attach the IC chip to the printed circuit board. The adhesive can cause electrical or mechanical problems such as reliability problems and the like. Post-lunch Blues I've been thinking a lot lately about getting out of a rut and improving myself. I need a change; this is a marathon and I want to stay in the race. I've recently decided to really do something about my health (while also doing something about my appearance). I know that this is going to take some time and money, but I

The present invention generally relates to a bandage which is made from a film of flexible, non-self-sealing material, is wound over a contour and applied to a wound site, and is sealed to the wound to protect the wound site from external influences. The present invention is particularly directed to the use of an anti-microbial agent, such as an anti-microbial agent known as norfloxacin, in the film. The present invention also relates to a method for

applying the bandage to a contour and to a method for sealing the bandage to a wound site. In recent years, the use of bandages for the treatment of wounds has become widespread. Bandages are applied by health care professionals and the lay person alike. Bandages for the treatment of wounds may be applied in conjunction with a medication, such as an anti-bacterial agent, which is used to treat the wound. While the anti-bacterial agent is effective, the agent may not be entirely absorbed by the wound. This may occur because the bandage used to treat the wound, even if it has a reservoir to receive the agent, may not be permeable to the anti-bacterial agent. When the agent is not absorbed by the wound, it may enter the bloodstream and cause a variety of unwanted side effects, such as nausea and fever. Thus, it is desirable to provide a bandage which is permeable to the anti-bacterial agent and which will absorb the agent and permit it to be absorbed into the wound. Additionally,

the anti-bacterial agent will eventually, over time, tend to be depleted from the bandage. This is because the anti-bacterial agent may be deactivated by exposure to air, sunlight, water, or enzymes. This leads to the need for replenishing the agent in the bandage. As disclosed in the parent application Ser. No.
