Since the first attempt to treat middle ear cholesteatoma by Delaire the new methods in the treatment of cholesteatoma have evolved to a great extent. In the modern treatment of middle ear cholesteatoma a radical or even total ear canal resection is almost always necessary. In most cases this procedure is also combined with a tympanoplasty. In earlier days extensive destruction of the ossicles was observed because of frequently inadequate reconstruction of the stapes. Nowadays such surgical procedures are performed with success rates of 95%. In more complicated cases of recurrent disease or massive cholesteatoma carefull reconstruction of the ossicles and tympanic membrane may be necessary. In this article the different techniques of reconstructive surgery are presented and discussed, including middle ear implantation in the ossicular chain.
