Abaqus/Explicit This is a finite element software developed and manufactured by Dassault Systèmes. Abaqus was introduced in 1997, and has since expanded into a broad range of commercial and civil engineering disciplines, such as architecture, interior design, packaging, manufacturing, mining, transportation, structural, facilities, geo-environmental, mechanical, hydro-environmental, architecture, engineering, and infrastructure. Along with the traditional finite element analysis (FEA) features of stress and strain analysis, Abaqus supports a large range of advanced analysis options to provide an accurate analysis of structures and components at the systems level. Multiphysics An example of a multiphysics analysis using Abaqus is that of the combination of advanced FEA and structural dynamics analysis for the purpose of the assessment of earthquake-proofability. FEM++ The FEM++ library is an open source finite element library for the C++ programming language developed by ITB-Bielefeld University for the use in computational sciences. The FEM++ library is primarily used to solve the finite element equations in numerical simulations. For FEM++ the basic equations are the same, but the numerical methods and algorithms differ from application to application. A number of commercial software packages such as ABAQUS, ANSYS, ANSYS HFSS, and ISAFLOW offer their own FEM libraries. Integrated analysis AIA - Analysis and Investigation of Airfields is the first commercially developed integrated analysis and survey system by PSI that was released in 1981. The AIA software is based on the software AIA C++ and is based on the software framework and language ObjectARX. The integrated analysis and survey system is currently being used by a number of customers including the German Air Force, Bundeswehr. The integrated analysis and survey system has been used by German military institutions and services since 1981, including Luftwaffe for the evaluation of a large number of projects. The integrated analysis and survey system has since been extended to different military applications. AIA C++ supports numerous components for the definition and creation of worklists and job schedules, the storage of data in data banks, the evaluation of input files and the generation of reports. The AIA C++ workflow framework ensures the definition of the sequence of the user operations as a connected network and allows the definition of user-specific settings. AIA C++ supports the definition of generalized and a1d647c40b
