The present invention relates to means for balancing magnetic disk drive data cartridge assemblies on a slant head assembly that is used in conjunction with an industrial drive, such as in an off-line data storage library, to retrieve or store data cartridges. The present invention addresses certain problems that are known to exist in prior approaches to such an objective, especially in industrial environments having well defined operating conditions. In various data storage library applications, it is not uncommon to employ a slant head device to access data cartridges

in order to read data from and/or to write data to the cartridges. Such devices provide, for instance, automatic means to drive a set of data cartridge assemblies into or out of engagement with a drive tray from which they can be subsequently removed from the drive tray for storage. The drive tray, which carries an insert, typically holds the data cartridge and is moved into position by the slant head in order to access the data cartridge by the slant head. A slant head drive device comprises, among other things, slant head (e.g., arms, a rail, etc.) on which a number of gripper assemblies are secured. Each of these gripper assemblies can grip a data cartridge to allow the corresponding arms of the slant head to move the data cartridge into or out of alignment with the slant head (e.g., for reading data from or writing data to the data cartridge). The industry has viewed a slant head as a desirable drive for this purpose. One important advantage of a slant

head is that the read/write assembly can move along a curved path within the data cartridges to complete all possible accesses to every track on a data cartridge. When the gripper assemblies grip a data cartridge, they must be designed to resist the weight of the data cartridge against the slant head. One problem with slant head design is that the weight of the data cartridge can create a
