What is the difference between val and var in scala Recently i have come across some code and these were defined like: `var a = 1 var b = 2 val c = 3` Now, my question is why there is a need for 'val' and 'var' at all? A: In scala if you want a "public" field with a type you can use var, but if you want a "private" field without any restrictions you can use val. You can do this: `val a: Int = 1 val b: Int = 2` but you can't: `var a: Int = 1 var b: Int = 2` When you try to declare var you can't specify a type for it, but when you define it like this: `val a = 1`

val b = 2 scala will infer the type to be Int, so you get this: scala> val a: Int = 1 a: Int = 1 scala> val b: Int = 2 b: Int = 2 So if you want to define a field as public, use var, but if you want a private field that can have a type scala will infer you don't need to use var. Comprehension of meaning in Norwegian: towards a better understanding of foreign language acquisition. The purpose of this study was to investigate how young native speakers of Norwegian process complex meanings of spoken and written language. It was hypothesised that the processing of

meaning in the spoken language of a new native language, like Norwegian, depends on the language of instruction spoken in the classroom. The comprehension of complex meaning in a new language has been investigated by means of a word-picture matching task. In this task, spoken and written language have been combined to enhance the ecological validity

I recently had a friend who had an iPhone that needed to be restored

because it wouldn't allow the user to unlock the phone with the pattern or password. I was able to restore his iPhone with iCloud Unlock and let him get all of his data back on it. All computers that are connected to the Internet have an IP address. If you want to access a computer that is not on your local network, you need to find out what its IP address is. The most common way to find out a computer's IP address is to use the ping command. In this tutorial, you will learn how to use the ping command to determine the IP address of a computer on a network.

By using ping, you can determine the IP address of a remote computer and its subnet mask. The subnet mask is the portion of an IP address that identifies the network on which a computer is located. The subnet mask of an IP address determines the network on which a computer is located. The command `-c` sets the number of iterations of sending a ping to the specified remote host. The default is 3. If you specify two IP addresses for the remote host, you can specify an incrementing sequence for your pings. The `-i` sets the interval (or interval of retries)

between each ping in milliseconds. The default interval is 1 ms. You may need to increase the interval if your network is slow. IP addresses for use with ping The ping command supports four address families: ipv4 address ipv6 address ipv4 local address ipv6 local address IPv4 Address IPv6 address IPv4 Local address IPv6 Local address The IPv4 address is usually expressed as an IP address with four blocks of numbers separated by periods. 192.168.0.20 2001:0db8:85a3:08d3:1319:8a2e:0370:7334 127.0.0.1 2001:0db8:85a3:0000:0000:8a2e:0370:7334 172.16.0.5 2

The software features a direct conversion of PDF files to DOCs. To perform the conversion, all you have to do is select the documents you want to convert and then click the 'Convert' button. ... and Adobe Acrobat are the most popular choices. However, the process is not difficult, and if you have a clean data recovery from your Mac or PC, the only thing you will need is to put the right software in place. To do this, here are a few recommendations that will ensure your data recovery plan

works for you: A. Backing up your files First, it is essential that you back up your data. There are many data recovery methods that can be used to recover lost, corrupt, or damaged files, but none of them are a sure-fire way of recovery. Instead, the best approach is to back up your data on a regular basis, and ensure that you also store those backups on a separate hard drive or at a cloud storage.

B. Checking your recovery plan You can recover your data using your backup, but the process will work better if you have already checked your backup beforehand.

You need to know exactly what you are doing, since there can be a chance that your backup won't work. Therefore, it is advisable to run a test by restoring a small file. This will allow you to check the various methods you plan to use to recover your data, and then run the recovery on a full system.

C. Securing your backup

If you have a backup solution like Time Machine, which creates a backup of your computer on a regular basis, you need to know that it can also make your files more secure. This is because your backup contains only a copy of the data, and

that is the only way to recover a file. Therefore, you need to be sure that you always back up your files in a safe location, and that the method you use is encrypted.

D. Your data recovery plan

Once you have a data recovery plan in place, you can check that you have everything you need. In addition, you can run tests for recovering specific files, and then download them. You can also run file recovery in the event that you lose a file, because you can recover everything from the exact same location.

E. Dealing with loss

The only thing that can make your

backup fail is if you lose your data. This is because your backup is a copy of everything that is on your computer, and this includes the files that you have lost. Therefore, you need to back up your files again, and also check that you have a duplicate set of your data. ... high quality of the images. Save PNG from PDF files is among the most convenient functions that enable you to convert PDF files to images easily. It lets you save PDF files in an easy-to
