Wireless communications devices typically use power amplifiers to boost the power of the transmission. When a wireless communications device is transmitting at low power levels, the power amplifier is not operating at its maximum capacity and thus typically results in unnecessary power consumption. FIG. 1 is a simplified block diagram of a typical wireless communications system. A wireless communications device, also referred to herein as a "UE" 10, communicates over a communications network using radio frequency (RF) signals with one or more base stations (BSs) 40. Transmitters 30 from the base station transmit RF signals over the communications link to the UE 10. In FIG. 1, the transmitter of the UE 10 is an RF power amplifier (PA) 30 operating in transmit (TX) mode, but the RF PA may instead be a low-power amplifier or a transmitter (TX) modulator. As shown in FIG. 1, a communications network typically includes one or more switches (SWs) 60 that receive signals and route the signals to their appropriate destination, e.g., a base station or the like. For example, for communication signals that are transmitted in a downlink (DL) direction, the SW 60 may route the RF signals to their appropriate destination. As shown in FIG. 1, a DL signal from the base station may be received by a first antenna 70a, routed by the SW 60 to the destination, e.g., to an RF PA 30, and transmitted by the transmitter 30 as an RF signal as out through an antenna 70b. As shown in FIG. 1, a reverse (uplink, or UL) signal from the UE 10 may be received by the antenna 70b, routed by the SW 60 to the destination, e.g., the RF PA 30, and transmitted by the transmitter 30 as an RF signal as out through an antenna 70c. In this manner, signals from the base station can reach their appropriate destination while signals from the UE 10 are communicated to the base station. One method for improving efficiency of a low-power amplification stage of a transmitter is to use a polar modulation transmitter. FIG. 2 is a simplified schematic diagram of a polar modulation transmitter. As shown in FIG. 2, the conventional polar modulation transmitter includes a low-power RF PA 80 and an envelope detector 90. A communication signal that is generated by a digital 570a42141b
