A: Note that you can retrieve the text ascii-encoded with a simple lxml.html.fromstring() Demo:  
from lxml.html import fromstring from io import BytesIO s = "" Sample Sample Sample Sample  
"" # Decode ascii-encoded, not unicode-encoded tree = fromstring(BytesIO(s.encode("ascii")),  
"html.parser") for p in tree.cssselect(".p"): print(p.text) Q: How can I better organise my grid  
from my data? I have a large number of data. Every time I see my data, it takes about the same  
time. I thought I could improve my coding with the use of a grid for my data. Is this the correct  
way to do so? Any suggestions? A: Yes, the standard collection object for such types of things is  
GridView. There are other options too, like DataGridView if you are using the.NET framework  
for 1.1 or earlier. Even without the framework, you can get a similar effect by using the  
Microsoft Forms Designer to create a control. Q: Adding Controls to Windows Service I'm  
building a Windows Service in Visual Studio 2010 using C#. I'm currently using the Windows  
Service project template. Currently, I'm adding my controls to the main form of the Windows  
Service by adding them to the form (e.g. using a button's click event, or a timer's tick event). In  
C++, I might be able to create a class that contains a list of the controls I want to add, and then  
use that list when I 4bc0debe42
