Understanding Photoshop Photoshop has been the industry standard for image editing for almost 20 years. Before the advent of Photoshop, picture-editing software was simple and crude. However, Photoshop is widely considered by designers, photographers, and others in the digital industry to be the best picture-editing software available. If you use other types of image editing software, you're likely to find that it lacks the robust features of the Photoshop image-editing program. Adobe publishes a number of tutorials, books, and courses that cover many aspects of Photoshop image editing. This chapter includes a brief introduction to the basics of Photoshop and then addresses different tools, functions, and techniques you can use in your workflow. Understanding the Edit Photoshop has three views of the image: the image itself, the layers that you have created, and the adjustment layers that enable you to create different kinds of edits. You use the image as an area to hold the different layers and shapes that you create. When you use Photoshop's tools and functions, you create new shapes that hold editing information. The image area of a Photoshop file is a blank canvas onto which you lay your new editing layers. You have other options for placing the image: Sometimes you can create a new document, known as a new file, and insert an image into a new file. You can create a new file by choosing File⇒New, or you can use a command in Photoshop itself. When you work in the original image, the layers and settings you make are applied to that image, so they remain visible when you reopen the image. You can save an image either as a JPEG file or in a specialized file type known as Photoshop Portable Document Format (PSD). If

Q: Migrating a python library from google colab to local machine I would like to use google colab for its simplicity of automatic import of data from remote servers using `make_pandas_dataframe`. However, for reasons I cannot explain I need to move a library that uses the `make_pandas_dataframe` method from google colab to my laptop. I am trying to use the python library that was installed on google colab but it does not seem to work and just gives me a message telling me that the target object is in a different context. How can I import the library with the `make_pandas_dataframe` method on my laptop? I tried to use the following code on my laptop to import the library but it did not work as well

```
!pip3 install --ignore-installed --user --upgrade -r /home/xi/.local/lib/python3.7/site-packages/requirements.txt
import numpy as np
import pandas as pd
from requests import session
import pandas_datareader.data as web
import pandas
from datetime import date, datetime
from pandas import DataFrame
df = pd.DataFrame(columns = ['Close','High','Low','Open'])
df.loc[0] = 11
df.loc[1] = 20
df.loc[2] = 30
df.loc[3] = 20
df.iloc[0]['Close'] = 14.91
df.iloc[0]['Close'].name = 'Ascending'
df.iloc[1]['Close'] = 16.23
df.iloc[1]['Close'].name = 'Descending'
df.iloc[2]['Close'] = 17.45
df.iloc[2]['Close'].name = 'Sinusoidal'
df.iloc[3]['Close'] = 18.45
df.iloc[3]['Close'].name = 'Sinusoidal_High'
df.iloc[3]['Close'] = 19.24
df.iloc[3]['Close'].name = 'Sinusoidal_Low'

[Experience of the surgical treatment of abdominal wall hernias in childhood]. The authors analysed their experience of surgical treatment of 117 abdominal wall hernias in 70 patients. In 8 patients a malformation of the abdominal wall was excluded (6 myelomeningocele, 1 meningocele, 1 coecal hernia). In 85 hernias they performed a standard operation (8 incisional hernias, 23 umbilical hernias, 54 femoral hernias). In 32 hernias they used the technique of the recurrence preventive complete fascial sutures (5 umbilical hernias, 10 femoral hernias, 17 hernias of the anterior parietal ligaments of the diaphragm). In 5 infants with recurrent umbilical hernias before 8 months they performed an umbilical hernioplasty with the application of synthetic bio-prosthetic material. In 2 children, in the age of 9 and 15 years, the authors employed the technique of the umbilical hernioplasty for correction of abdominal wall defects. In this case, the authors failed to use the umbilical hernioplasty in babies. In 2 children with recurrent hernias of the anterior parietal ligament of the diaphragm they performed the simultaneous repair of diaphragmatic defects. After 26.6 months, the authors observed the postoperative complications, which have been detected in 6 patients: the wound infection ($n = 5$), an intestinal hernia ($n = 1$). The authors recommend the use of complete fascial sutures in all children under the age of 12 months for the prevention of the postoperative hernia and for the correction of abdominal wall defects.
