Archicad 2 Download ArchiCAD 2.Q: How to get item in an arraylist with certain value by matching the value of another arraylist? Assume, I have an ArrayList like this: String[] a = {"100", "101", "102", "103"}; And an arraylist like this: ArrayList b = new ArrayList(); b.add(1); b.add(2); b.add(4); b.add(5); b.add(7); b.add(8); b.add(10); b.add(15); b.add(20); How to get the value of the item (in an arraylist of integers) which is contained in the arraylist "a" and whose value is in the arraylist "b"? In our case in the following arraylist: ArrayList c = new ArrayList(); c.add(4); c.add(8); c.add(15); c.add(20); I can't give the integer which contains the same value as the item 4 in the arraylist "a". I can only give the arraylist which contains the integer 4. So, how can I get the arraylist "c" which contains 4? A: From your question you want to solve problem: Find the integer in arraylist b which contains the value of the item of an arraylist a If I understand correctly this mean you want to search between b and a You have to use the method "equals()" to compare string. Then in the code example if I understand well you want to search only for the exact same value (if you want more than only one found just use "get(index)")

```
public static void main(String[] args) { String[] a = {"100", "101", "102", "103"}; ArrayList b = new ArrayList
```
