What I tried so far: I got a piece of code that detects the URL and the extension when it's downloaded: `$file = Get-Item "$fullFilePath" $extension = Get-Extension $file.Extension $file.Extension` I then tried to use that extension to get the URL but it doesn't work: `$extension = "patch" Get-Item $fullFilePath -Extension $extension | Where-Object {$_.Url -like '*patch*'}` I also tried to create a function that uses `Split-Path` and changes the path to the filename, but it doesn't work either: `$name = Split-Path -Path $fullFilePath -Leaf $name $name = "ChangelogPatch.zip" Get-Item $fullFilePath -Name $name` Edit: I've also tried to get a program to get the filenames, but I'm really new at scripting, so this is just an experiment for me. I'm not trying to make this program awesome, I just want the files that contain only those strings so I can get the names of the files that I need. So this is my code: `@('Windows','macOS','Linux') $filenames = Get-ChildItem $fullFilePath -Filter $($_) $filenames $filenames[0] $filenames[0] | Select-Object Name` And this is the output: PS C:\Users\Dmitri\Desktop> `$('Windows','macOS','Linux')` Security Warning: Cannot evaluate the expression `['Windows','macOS','Linux']` because the input is not within the bounds of the array. At C:\Users\Dmitri\Desktop\New_Scripts\test.ps1:9 char:19 + `['Windows','macOS','Linux']` + ~~~~~~ + CategoryInfo : InvalidArgument: (Windows:String[]) [], RuntimeException + FullyQualifiedErrorId :

ArgumentOutOfRangeException PS

IOS multitasking I need a iOS Multitasking screen that have a back button, when the user press on the back button the app return to the first screen. I also need a control bar in the left side of the screen. IOS Application..

IOS APP · A: There isn't really a way to code the UI you want without having access to the rest of the screen.

There is a built in control that might be what you're looking for. UITabBarController Or you could write a custom control that will know what state to transition to based on user interaction. The easiest way to get started

is: Follow the @mattkmac1 instructions on his github page, Download his template app from his github page, and Build a few example projects. The example project is at Here are the steps necessary to get up and running

Navigate to Xcode and select New > Project Select iOS >

Single View Application Name your project j Find it at Select the project Open Main.storyboard Add a navigation bar by Control-dragging it to the top of the view Select the Navigation Bar control Configure it as needed Link it to your root view controller's Navigation Controller Connect it to the File's Owner outlet in your root view controller (it should be highlighted in blue and linked) Try building the app. You should see a navigation bar at the top and a back button on the navigation bar.

Q: Android Java local database I am building a game in Android, and I want to save a list of items (name, price, etc.) in some sort of local database for these items.

Anybody knows how I can do this? I am currently using SQLiteOpenHelper, how can I implement this? A: You can

create a User class that has all the data as member variables. class User { String name; int id; int price; int points; // Methods // Methods } Then, whenever you are going to add a new entry, get an instance of User. User user = new User(); //
