Faster Photoshop Enabling hardware acceleration enables Photoshop to work faster. When you double-click a layer, Photoshop creates and opens that layer in the Canvas window. When you apply a filter to a layer, you also apply it to all other layers that are grouped with that layer. If you apply a filter to a group of layers, you apply the filter to all of the group's layers. Enhancing Photoshop The simplest way to enhance an image is to adjust the brightness, contrast, color saturation, and color balance. You access these features in Photoshop by first double-clicking to create a new layer on which you apply all the adjustments. You can fine-tune these features before you save the changes in the Save for Web and Devices dialog box. PhotoToolbox The main tool in PhotoToolbox is a Brush, which is used to apply, or paint, an image effect on an existing layer or a new layer. Use the buttons to select a brush or brush preset, and then use the Brush window to make adjustments to the brush before you start painting. The Brush window and other tools enable you to control how brush strokes are applied and the appearance of brush strokes. PhotoToolbox is located on your hard drive within your Photoshop installation. To open it, choose Image⇒Photoshop⇒PhotoToolbox. You'll see a list of tools with a plus sign at the far right to open or close the window. Photoshop enables you to custom-name tools, making them easier to find. New tools include the following: Blur: This effect gives a softer look to an image and is often used to soften skin and make faces look younger. Burn: This tool darkens an area of an image and works well on richly colored images to tame the color and make darker areas seem more dramatic. Dodge and Burn: This tool makes areas look brighter. To open and use these tools, you select a Brush tool from the Tools panel and then click a tool in the center of the Brush window.

The present disclosure relates generally to a broadcast television system and, more specifically, to a server for a broadcast television system. A broadcast television system is a group of devices that transmit and receive audio, video and/or data signals to multiple receivers using a single broadcast medium. The broadcast medium may be, for example, a satellite, cable, terrestrial or other such broadcast medium that allows a group of devices to communicate with each other. A typical broadcast television system includes a multi-cast distribution facility, a broadcast distribution facility, one or more headends and one or more set top boxes in communication with the multi-cast distribution facility and the broadcast distribution facility. The multi-cast distribution facility receives audio, video and data signals from service providers and converts the signal to a broadcast signal for distribution to multiple headends. The multi-cast distribution facility may also convert the received broadcast signals to a different broadcast signal for transmission to the set top boxes. The headends then transmit the received signals to the set top boxes. The set top boxes decode the received broadcast signals and supply the decoded signals to one or more television sets and/or to other output devices, such as DVD players, set-top boxes and/or other devices. Some network management applications are used to manage a broadcast television system. These management applications may be, for example, a headend management system or a network management system. As part of the management applications, one or more configuration files may be used to communicate configuration information between the management applications. When a set top box is added to a network, a set top box manufacturer may also provide a complete or partial set of configuration files corresponding to the newly added set top box. The management application is then used to transfer the configuration files associated with the new set top box to the headend of the system. When a set top box is added to a network, a set top box manufacturer may also provide a set of configuration files corresponding to the new set top box. These configuration files may include information used to configure the set top box for receiving and/or decoding a broadcast signal and also to configure the set top box for communicating with various other devices, such as a multi-cast distribution facility, a broadcast distribution facility, the headend and/or other set top boxes. The configuration files for the new set top box may be compatible with the management applications used for the broadcast television system. In such an instance, the set top box may be added to the broadcast television system without major modifications to the existing management application.

Gender and food choices in 2- to 5-year-old children in Madurai, India. To assess changes in the diet of children 2 to 5 years of age in Madurai, India. A prospective cohort study of 1000 children was carried out. We assessed the frequency and quantities of intakes of all food items and the nutrient intakes of their respective subgroups according to gender. The frequency of intake of breakfast, snack, and dinner was highly variable with no consistent pattern across age. Overall, the mean weight of the children increased from 1994 to 1999 from 10.3 kg to 12.1 kg. Thus, the mean intake of food items decreased from 14.3 to 12.5 kg of food per person and per day. This represented a 17% decrease in the consumption of food per person, and a 5% decrease in the intake of food per day. The most marked dietary change was the decrease in the consumption of food served as breakfast, which was inversely proportional to the increase in milk intake. The low-calorie snack was replaced by "sweets and chocolates" and highly caloric snack foods of fried items. Our study indicated a shift from a traditional diet of several breakfast items and a poor quality snack and dinner to a diet that was high in milk and meat and low in green vegetables and fruit.Q: Two fragments on top of each other I have 2 fragments.
