

Using layers. You can use layers to make unlimited changes to an image and easily undo your work. Each layer can have its own color, brightness, or contrast. Layers stack on top of each other, so it's as easy to work on them in succession as to work on a single layer. Layers can be saved as separate files or grouped for bulk editing. Adobe's own tutorials (available online at `www.adobe.com`) and books on using Photoshop (see the nearby sidebar) are excellent sources for learning Photoshop. You can create and save your own shape objects and place them on your screen, such as a circle or rectangle, and even transform them into a path object. These special effects let you use text and other graphic elements to replace a brush, rather than having to use your paintbrush to adjust a specific area. Some of Photoshop's tools, such as levels, are also available in the other Adobe apps, including Illustrator. **Digital movie-making with After Effects**. Adobe After Effects is a program to create television and film productions. It has powerful features for making video animations, including a feature called Image-based lighting that lets you use artistic lighting techniques to create and render images on the fly. See the nearby sidebar for more about After Effects. It's definitely an expensive program—\$250 for the Standard version and \$350 for the Pro version—but a program like this is a must-have for anyone interested in making digital videos. If you make videos professionally, or even if you simply want to create video effects that you can share, you'll find that this program can save you hundreds of hours of work. You can use After Effects with a digital film camera and HDTV. For example, here's a video I created in After Effects that shows how to use an HD camera to create high definition video: Figure 15-2. After Effects makes it easy to create 3D effects such as exploding fireworks, by using a blend mode called Breathing. With this mode, a 3D object interacts with the rest of the scene by dissolving in and out of the picture over time. At the bottom of the window in Figure 15-2 is an effect called Breathing. With this mode, a 3D object interacts with the rest of the scene by dissolving in and out of the picture over time. In this case, the fireworks explosion is

Q: How do you link directly to a PDF or SVG file? How can one link to a PDF or SVG file? For instance, I want to include this reference link directly in a slide or presentation, but it can't contain a hyperlink to the PDF. The PDF is too large, and opening the file in another window would take too long. I want to simply link to the file, by including an inline reference to the PDF file. A: pdf files can be embedded in html, and sometimes even appear in the sidebar, but unless you actually want to show the file contents inside a slide, you are better off just referring to the file directly. A: Even though I think it's better to refer the file, you can put the file link in the Slides area if the file is hosted online. An example: Here the file is in the ESSUG page. A: I found a way. You can see the full solution, with the complete reference to the article in which I found this, on my pastebin website. the compatibility and the Linux driver was present I was able to say it had loads of dkms modules at boot time lool, do you have any idea how we can remove the ubuntu patches/additional files and the dkms modules? lool, is it done via script? or source based? manjo: You have the source tree, I'd just comment the ubuntu patch out You might have to run autoremove --purge Just comment out the Ubuntu patches source-based lool, thats ok for me, I was concerned about just removing the ubuntu patches so that we can roll the same in the new... And you want to comment out the ubuntu patch, but not remove the ubuntu patch? I'm not sure why you're confusing debian-kernel-scripts and ubuntu-kernel-scripts there In any case, debian-kernel-scripts has tools to remove the Ubuntu patch, it's easy I think the easiest would be to have debian-kernel-scripts remove the patch and call the new kernel, but you already have source code; just comment out the patch, test it with the new kernel and upload lool, ok.. I will try debian-kernel-scripts to get it ready lool, ok lemme try with it.. lool, I hope the output of debian-kernel-scripts will show that the ubuntu patch is removed from the source? It's added at build-time ie. the rule to generate the ubuntu patches is in debian-kernel-scripts debian-kernel-scripts runs on top of the source tree You remove a patch it won't delete it from the source tree; it will just tell dpkg-buildpackage not to apply that patch when you're building the package lool, ok.. that's fine... thats exactly what I was worried about... lool, the way I am familiar with is that I first build the kernel with the ub
