(Reuters Health) - For most people with celiac disease, a gluten-free diet cures diarrhea and other gastrointestinal symptoms, but one in eight patients with this autoimmune disease have symptoms that don't disappear when they go gluten-free, according to a new review. Celiac disease is the most common autoimmune disorder in the U.S. It's an inherited disorder that causes the body's immune system to attack the small intestine, damaging the villi, or small projections, in that organ. Villi are needed for absorbing nutrients from food. The symptoms of celiac disease - which mainly include stomachaches, fatigue, diarrhea, eczema, headache, depression, and poor nutrient absorption - include bloating and unexplained weight loss. More than 2 million Americans have celiac disease, and about 1 in every 133 people in the U.S. is thought to have it. "Diagnosis of celiac disease can be elusive and the disease can be difficult to diagnose in children and adolescents due to their less-recognized symptoms," said lead study author Dr. Sheela Ramchandani of the University of Alabama at Birmingham in Birmingham, Alabama. "Celiac disease should not be dismissed as a diagnosis in patients with symptoms that may or may not be related to gluten consumption," she added by email. To get a sense of how common persistent diarrhea might be, Ramchandani and colleagues used a computer database of medical records kept by a large health maintenance organization to look for cases of celiac disease among more than 240,000 people who were given a diagnosis of celiac disease between 2006 and 2014. These patients were then tracked for five years to see if they'd developed persistent diarrhea as defined by the National Institute of Diabetes and Digestive and Kidney Diseases, which includes cases where symptoms last for more than four weeks. Of the people with celiac disease, 18 percent had persistent diarrhea, and of those, most had diarrhea for less than a month. "Currently, there is no good data to use as a benchmark for persistent diarrhea in celiac disease," Ramchandani said. "The Mayo Clinic used to diagnose a patient with celiac disease when the patient had diarrhea lasting more than four weeks, but the Mayo Clinic no longer follows this practice." Another factor that could explain why persistent diarrhea might be more common among people with
