How can I find them? If you run the command history | grep or history | grep | grep install in the terminal, you should be able to find the packages you installed. If the packages were installed with dpkg, and not apt, you can use dpkg -L or dpkg -L \$(which ) to list the contents of the package. A: You can also use the command history | grep install | cut -d " " -f2- The line after the cut will be the package name. Q: Odd combination of invalid use of rvalue reference, no move constructor, and template assignment operators I'm trying to convert a free function which implements a graph algorithm that takes a pair to the more general pair. I'm having trouble implementing the move constructor and assignment operators because of template specializations that add complexity. Here is the old version with a copy constructor and assignment operators that would take the less-than operator, which is not a valid template argument for pair. That particular case works because we know that the first argument is bool and the second is bool. template inline void insert\_vertex(int v) { if(v inline void insert\_vertex(int v) { if(v (false, false); vertex[v] = std::move(less\_than); } } A: You should think about your problem in terms of what you want the move constructor to do. What happens when you move a pair from one container to another? What's the value type of the first element of the pair? What's the value type of the second element of the pair? The only option for the compiler is to have the first element's value type be T and the second element's value type be U. Another option would be
