While Photoshop and Elements are based on the same PSD file format, some of the capabilities are different. At its heart, Photoshop Elements is a graphics editor. Photoshop is a professional, professional and business-ready photo editor which comes loaded with more features such as white balance, flexible editing tools, retouching, fonts, full color management, artistic filters and more. This guide will teach you how to work with Photoshop Elements and PSD files in a simple, easy-to-learn method, without losing the power of Photoshop. What is Photoshop? Photoshop is a professional photo editor and graphics application developed by Adobe Systems Inc. It's the most popular graphics editing software and is used by photographers, graphic designers, web designers, illustrators, and many others. Adobe Photoshop has evolved over the years and now offers a plethora of tools, from image editing to artistic effects and photo retouching, while maintaining the simple UI that is the trademark of Adobe software. Photoshop is available for Windows, macOS and Linux. What's Photoshop Elements? Adobe Photoshop Elements is a graphics editor and software for photography. It has more than half the features, and offers drag-and-drop support when using the desktop. You can easily edit your photos in Adobe Photoshop Elements, whereas Photoshop is professional and requires the 05a79cecff

Q: Geometric interpretation of infinitesimal sheaf Let  $f:\mathcal{X}\rightarrow S$  be a smooth morphism of schemes. For every  $s\in S$ , we define  $\mathcal{O}_{\mathcal{X}_s}$  the sheaf associated to  $\mathcal{O}_{\mathcal{X}}$  by forgetting  $f$ . We say that the sheaf  $\mathcal{O}_{\mathcal{X}_s}$  is infinitesimally trivial at  $s\in S$  if  $\mathcal{O}_{\mathcal{X}_s}$  is equal to  $f^*\mathcal{O}_S$ . Is there a geometric interpretation of this in the spirit of "the geometric fibers" in algebraic geometry? The example I have in mind is the case where  $f$  is the structure morphism of a smooth curve  $C$  over an algebraically closed field. Can we say something about a (nonsmooth) curve  $C$  over a field  $k$  such that  $\mathcal{O}_{\mathcal{X}_s}$  is isomorphic to  $\mathcal{O}_{C_s}$  for a single geometric point  $s\in C$ ? A: This is one of the most mysterious and seldom asked questions in differential geometry. You can find some things in books of Fulton and Harris. Now answering the question. First consider  $X=\mathbb{P}^2\backslash\{y_0+y_1+y_2=0\}$  and the projection from the point  $[1:1:1]$ . Consider the family of curves  $C=\{y_0+y_1+y_2=0\}$  and the pencil of cubic curves through the point  $[1:1:1]$ , which we identify with  $\mathbb{P}^1$ . The fiber  $C_0$  over  $[1:1:1]$  is just  $\{y_0=y_1=y_2\}$ . Let  $T\rightarrow \mathbb{P}^1$  be the trivial family of curves of genus 0, i.e. the family of the affine curves  $\{y_0=y$
