Field of the Invention The present invention relates to a liquid crystal display (LCD), and more particularly, to an LCD with an improved light transmittance. 2. Description of the Related Art Generally, a liquid crystal display (LCD) has been applied for displaying an image in the electronic industry. A LCD includes a thin film transistor (TFT) substrate, a color filter (CF) substrate, and a liquid crystal layer. An LCD is not self-luminous and displays an image by adjusting the amount of light passing through a liquid crystal layer using a variation in refractive index of the liquid crystal layer due to an electric field. Accordingly, the LCD displays an image by adjusting the light transmittance of the liquid crystal layer. The light transmittance of the liquid crystal layer is changed by changing the phase of the liquid crystal. As a result, the light transmittance is adjusted by controlling the phase of the liquid crystal layer using a voltage applied to a transparent conductive layer, so that an image is displayed. A manufacturing process of an LCD generally includes a thin film forming process, a photolithography process, an etching process, a deposition process, a sputtering process, an orientation film forming process, a liquid crystal injecting process, and so on. In the LCD, the liquid crystal layer is aligned in a predetermined direction by the vertical alignment of the liquid crystal, and the liquid crystal displaying property is improved by maintaining the vertical alignment of the liquid crystal layer. Specifically, the liquid crystal displays a horizontal electric field, and in the case where the liquid crystal layer is not aligned in the vertical direction, the liquid crystal layer is unevenly distributed in the horizontal direction, so that the light transmittance is deteriorated. In order to suppress the vertical alignment of the liquid crystal, the liquid crystal layer is rubbed to make a pretilt angle. Also, the liquid crystal layer is injected in the liquid crystal layer in a 6d1f23a050
