invertible, is it also invertible in a block form? Suppose that A is a 3×3 matrix with entries that are all real numbers. Suppose also that A is invertible, i.e., A^{-1} exists. Does it follow that A^T is invertible? A: No it is not invertible. Consider $A=\pmatrix{1&0\\0&-1}$. Then A is invertible. However $A^T=\pmatrix{1&0\\0&1}$. Serum electrolyte imbalance in patients undergoing non-cardiac surgery. Serum electrolyte levels were measured in 100 patients before and after major non-cardiac surgery for the first time and 8 days later. In all but three cases, the serum sodium concentration fell within the preoperative value, and the serum chloride concentrations fell to subnormal levels in 17%. Hyponatraemia occurred in two cases only. Serum potassium concentrations fell by 0.9 mmol/l within 24 h after operation in three patients (3%) with preoperative hypokalaemia. Seven patients had preoperative hyperkalaemia; and in five cases, serum potassium concentration rose by more than 0.3 mmol/l after operation. Serum potassium is a valuable marker of acid-base imbalance in patients with renal and adrenocortical failure. Hyperkalaemia is common after surgery and tends to be present in patients with pre-existing hyperkalaemia, preoperative hypertension and renal failure.Q: What is the difference between dual-threading and multiple processors? I read somewhere that Web Server can has multiple processors, and dual-threads. I want to understand what does this mean. I know about processors, but what is threads? What is the relation between threads and processors and what is the difference between dual-threading and multiple processors? A: I think what you are trying to understand is the difference between a multi-core processor and dual-threading. For the most part, a multi-core processor is a processor that has multiple independent execution units, each of which can execute one instruction at 6d1f23a050
